10 / 10 submitted

Q1. Operators in Python

ANSWER

operators in python are special symbols, keywords used to perform operations on variables

1. arithmetic operators
2. relational operators
3. logical operators
4. bitwise operators
5. identity operators
6. membership operators
7. assignment operators

Q2. Operators

ANSWER

DIVISION

performs floating point division

EG $7/2 = 3.5$

FLOOR DIV

divides the first operand by the second number and it gives result like nearest integer eg $7//2 = 3$

MOD

performs the division and returns the remainder eg $7 \% 2 = 1$

EXPONENTIATION

power eg $7 ** 2 = 49$

Q3. for and while loop

ANSWER

it goes through the sequence and executes the code for each time until it reaches the end, loop is used when number is already known and while is used when the number is unknown

Q4. range()

ANSWER

range generates immutable sequence

for range(5)

range = starts from 0 and increment by 1 upto 5

for range(1, 6)

starts from 1 and incre by 1 upto 6

for range(1, 10, 2)

Q5. String

ANSWER

it stores the variables in a double quotes or single quotes and it is immutable

Q6. String Slice

ANSWER

ytho
nohtyp
pto
hon

Q7. List

ANSWER

list is the collection of many data types and it is mutable
string is the collection of characters and it is immutable

Q8. List Slice

ANSWER

[30,40,50,60]
[10,20,30,40]
[10,30,50,70]
[70,60,50,40,30]
[40,50,60]

Q9. Index

ANSWER

positive starts from 0 and moves towards right
negative starts from -1 and moves left

Q10. length

ANSWER

len() returns total no of elements
count() returns how many times the element appears
